1 Introduction

mRMRe is an R package for parallelized mRMR ensemble feature selection.

1.1 Installation and Settings

mRMRe requires that *Rcpp* is installed. These should be installed automatically when you install *mRMRe*. Install *mRMRe* from CRAN or Bioconductor using *biocLite* function.

```
> install.packages("mRMRe")
```

Load *mRMRe* into your current workspace:

```
> library(mRMRe)
```

The *mRMRe* package allows its users to set the number of threads it will use for computations. One should may consider the following method to avoid crowding computing clusters, or fully utilize them.

```
> set.thread.count(2)
```

Load the example dataset *cgps* into your current workspace:

```
> data(cgps)
```

```
> data.annot <- data.frame(cgps.annot)
```

```
> data.cgps <- data.frame(cgps.ic50, cgps.ge)
```

1.2 Requirements

mRMRe has only been tested on Windows and Linux platforms. It requires that the *openMP* C library be installed on the hosts on which the package is intended to run.

2 Measures of Association

2.1 Mutual Information Matrix

mRMRe offers a fully parallelized implementation to compute the Mutual Information Matrix (MIM). The object `data_cgps` should be a dataframe with samples/observations in rows and features/variables in columns. The method supports the following column types: "numeric" ("integer" or "double"), "ordered factor" and "Surv". Mutual information (MI) between two columns is estimated using a linear approximation based on correlation such that MI is estimated as $I(x, y) = -\frac{1}{2} \ln(1 - \rho(x, y)^2)$, where I and ρ respectively represent the MI and correlation coefficient between features x and y . Correlation between continuous variables can be computed using either Pearson's or Spearman's estimators, while Cramer's V and Somers' Dxy index are used for correlation between discrete variables and between continuous variables and survival data, respectively.

```
> ## Test on a dummy dataset.
>
> # Create a dummy data set
> library(survival)
> df <- data.frame(
+   "surv1" = Surv(runif(100),
+                 sample(0:1, 100, replace = TRUE)),
+   "cont1" = runif(100),
+   "disc1" = factor(sample(1:5, 100, replace = TRUE),
+                   ordered = TRUE),
+   "surv2" = Surv(runif(100),
+                 sample(0:1, 100, replace = TRUE)),
+   "cont2" = runif(100),
+   "cont3" = runif(100),
+   "surv3" = Surv(runif(100),
+                 sample(0:1, 100, replace = TRUE)),
+   "disc2" = factor(sample(1:5, 100, replace = TRUE),
+                   ordered = TRUE))
> dd <- mRMR.data(data = df)
> # Show a partial mutual information matrix.
> print(mim(subsetData(dd, 1:4, 1:4)))
```

```

          surv1      cont1      disc1      surv2
surv1 0.00000000      Inf      Inf 0.00000000
cont1      Inf      Inf 0.01838418 0.05889152
disc1      Inf 0.01838418      Inf      Inf
surv2 0.05889152 0.05889152      Inf 0.00000000

```

```

> ## Test on the 'cgps' dataset, where the
> ## variables are all of continuous type.
>
> dd <- mRMR.data(data = data.cgps)
> dd <- subsetData(dd, 1:10, 1:10)
> # Uses Spearman as correlation estimator
> spearman_mim <- mim(dd, continuous_estimator = "spearman")
> print(spearman_mim[1:4, 1:4])

```

```

          cgps.ic50 geneid_3310 geneid_2978 geneid_6352
cgps.ic50      Inf 0.025796493 0.000900719 0.108915849
geneid_3310 0.025796493      Inf 0.017968244 0.002227175
geneid_2978 0.000900719 0.017968244      Inf 0.050207046
geneid_6352 0.108915849 0.002227175 0.050207046      Inf

```

```

> # Uses Pearson as correlation estimator
> pearson_mim <- mim(dd, continuous_estimator = "pearson")
> print(pearson_mim[1:4, 1:4])

```

```

          cgps.ic50 geneid_3310 geneid_2978 geneid_6352
cgps.ic50      Inf 0.02104964 7.541758e-05 0.09249434
geneid_3310 2.104964e-02      Inf 2.450671e-02 0.02740061
geneid_2978 7.541758e-05 0.02450671      Inf 0.05790450
geneid_6352 9.249434e-02 0.02740061 5.790450e-02      Inf

```

2.2 Correlations

The mRMRe package offers an efficient, stratified and weighted implementation of the major correlation estimators: Cramer's V, Somers Dxy index (based on the concordance index), Pearson, Spearman correlation coefficients.

```

> # Compute c-index between feature 1 and 2
> correlate(cgps.ge[, 1], cgps.ge[, 2], method = "cindex")

```

```

> # Compute Cramer's V
> x <- sample(factor(c("CAT_1", "CAT_2", "CAT_3"),
+                   ordered = TRUE), 100, replace = TRUE)
> y <- sample(factor(c("CAT_1", "CAT_2"),
+                   ordered = TRUE), 100, replace = TRUE)
> correlate(x, y, method = "cramersv")
> # Compute Pearson coefficient with random strata and
> # sample weights between features 1 and 2
> strata <- sample(factor(c("STRATUM_1", "STRATUM_2",
+                         "STRATUM_3"),
+                       ordered = TRUE),
+                 nrow(cgps.ge), replace = TRUE)
> weights <- runif(nrow(cgps.ge))
> correlate(cgps.ge[, 1], cgps.ge[, 2], strata = strata,
+          weights = weights, method = "pearson")

```

3 mRMR Feature Selection

mRMR offers a highly efficient implementation of the mRMR feature selection [2, 4]. The two crucial aspects of our implementation consists first, in parallelizing the key steps of the algorithm and second, in using a lazy procedure to compute only the part of the MIM that is required during the search for the best set of features (instead of estimating the full MIM).

3.1 Classic mRMR

Here is an example of the classic mRMR feature selection [2].

```

> dd <- mRMR.data(data = data.cgps)
> mRMR.classic(data = dd, target_indices = c(1),
+             feature_count = 30)

```

3.2 Ensemble mRMR

```

> dd <- mRMR.data(data = data.cgps)
> # For mRMR.classic-like results
> mRMR.ensemble(data = dd, target_indices = c(1),

```

```

+           solution_count = 1, feature_count = 30)
> # For mRMR.ensemble-like results
> mRMR.ensemble(data = dd, target_indices = c(1),
+           solution_count = 5, feature_count = 30)

```

4 Fixed Selected Features

The mRMRe package allows to select the features with some features being fixed selected, also supports the return with/without the fixed ones

```

> ensemble <- mRMR.ensemble(data = dd, target_indices = c(1),
+           solution_count = 5,
+           feature_count = 10,
+           fixed_feature_count = 1)
> solutions(ensemble, with_fixed_features = FALSE)

```

5 Causality Inference

The mRMRe package allows one to infer causality through the use of the co-information lattice method [1, 3].

```

> ensemble <- mRMR.ensemble(data = dd, target_indices = c(1),
+           solution_count = 5,
+           feature_count = 10)
> causality(ensemble)

```

6 Session Info

- R version 4.1.0 (2021-05-18), x86_64-pc-linux-gnu
